Mission Statement
“Leveraging on partnerships and innovative technologies, to produce and disseminate relevant, quality, timely statistics and spatial data that are fit-for-purpose in accordance with international standards and best practice”

Vision Statement
“Be a high performance institution in quality statistics delivery”

Core Values
Integrity
Excellent Performance
Accuracy
Team Work
Accountability
Transparency

Preface

This bulletin presents updates on the quarterly Producer Price Indices (PPI) for ten industries namely: Mining of uranium and thorium ores; Mining of other non-ferrous metal ores; Other mining and quarrying n.e.c.; Processing and preserving of meat; Manufacture of malt liquors and malt; Manufacture of soft drinks; production of mineral water and other bottled water; Manufacture of basic precious and other non-ferrous metals; Manufacture of cement, lime and plaster; Electric power generation, transmission and distribution; and Water collection, treatment and supply. The bulletin outlines the Producer Price Index for the period covering the first quarter of 2022 (January to March 2022).

The Producer Price Index (PPI) measures the rate of change in the prices of goods and services bought and sold by local producers. The PPI is designed to measure the average change in the price of goods and services either as they leave the place of production or as they enter the production process and it does not include imported products. Thus, the prices for monitoring changes in the PPI behavior are measured from the perspective of the local producer.

The PPI is part of a suite of price indices in Economic Statistics, Consumer Price Indices included, which are key and important price monitoring macroeconomic indicators. Price instability introduces uncertainty into economic analysis and decision-making, so the main use of the PPI is to minimize such uncertainty. The other significant uses of PPI inter-alia include: monitor short-term inflationary trends; deflator in the compilation of the National Accounts; and contract price adjustments as well as wage negotiations.

It is the intention of the Namibia Statistics Agency (NSA) to expand this publication by including more industries as and when the data becomes available. It is at this juncture that I would like to extend my gratitude and appreciation to all stakeholders who assisted in the production of this bulletin. In the same vein, I would like to urge our users of statistical information to send to us any comments that may enhance the quality of this report at info@nsa.org.na

Alex Shimuafeni
Statistician-General & CEO
1. Mining and quarrying

1.1 Mining and quarrying

For the first quarter of 2022, the index for Mining of uranium, and thorium ores (ISIC 0721) increased to 88.0 basis points, representing an increase of 48.4 percent when compared to 59.3 basis points recorded during the same period of last year.

Chart 1: Annual Percent change in PPI for Mining of Uranium & thorium ores
1.2 PPI for Mining of other non-ferrous metal ores (ISIC 0729)

The index for Mining of other non-ferrous metal ores includes mining and preparation of ores valued chiefly for their non-ferrous metal content: for example, aluminum (bauxite), copper, lead, zinc as well as precious metals such as gold, silver and platinum. This category excludes mining and preparation of uranium and thorium ores, reported (ISIC 0721). The index for this industry increased to 185.2 basis points in the first quarter of 2022 from 155.1 basis points recorded in the same quarter of 2021, increasing the level of prices by 19.4 percent during the quarter under review when compared to the same period of 2021.
1.3 PPI for Other mining and quarrying (ISIC 08)

The index for other mining and quarrying includes mining and extraction of diamonds, which is a significant activity in Namibia’s mining sector. During the first quarter of 2022, the index for this sector increased to 124.1 basis points from 115.1 basis points recorded during the same quarter a year ago, translating in a year-on-year inflation rate of 7.9 percent.

Chart 3: Annual percentage change in PPI for other mining & quarrying
2. Manufacturing

2.1 PPI for Processing and preserving of meat (ISIC 1010)

The PPI for this category covers output by producers in the processing and preserving of meat sector. This sector includes the operation of slaughterhouses including slaughtering, dressing, packing of meat and the production of fresh, chilled or frozen meat. It also includes the production of dried, salted or smoked meat and other meat products for example, sausages, salami, pâtés, and boiled ham.

In the first quarter of 2022, the PPI for processing and preserving of meat increased by 21.1 basis points from 162.5 basis points recorded in the same quarter of 2021 to 183.6 basis points. Implying that prices within this sector increased by 13.0 percent during the reporting quarter compared to the same quarter of last year.

Chart 4: Annual percentage change in PPI for processing & preserving of meat
2.2 PPI for Manufacture of malt liquors and malt (ISIC 1103)

The index for the manufacturing of malt liquors and malt increased to 131.2 basis points during the first quarter of 2022, 6.4 basis points more than 124.8 basis points recorded in the corresponding quarter of 2021. This translates into an annual growth rate of 5.1 percent in the prices of goods manufactured within this sector in comparison the prices of last year.

Chart 5: Annual percentage change in PPI for manufacture of malt liquors & malt
2.3 PPI for Manufacture of soft drinks; production of mineral waters and other bottled waters (ISIC 1104)

This category constitutes the PPI for the manufacture of soft drinks; production of mineral waters and other bottled waters (ISIC 1104). During the first quarter of 2022 the index for this class stood at 124.6 basis points compared to 115.4 basis points registered in the same quarter of 2021. Resulting into an inflation rate of 8.0 percent against a lower rate of 5.3 percent recorded in the same quarter of 2021.

Chart 6: Annual percentage for manufacture of soft drinks; production of mineral waters & other bottled waters
2.4 PPI for Manufacture of cement, lime and plaster (ISIC 2394)

The index for this category stood at 95.8 basis points during the quarter under review compared to 98.9 basis points witnessed in the same quarter of 2021. This translates into a decline of 3.1 percent in the prices of products under this category when compared to the growth rate of 0.8 percent registered during the corresponding period of 2021.

Chart 7: Annual percentage change for manufacture of cement; lime & plaster
2.5 PPI for Manufacture of basic precious and other non-ferrous metals (ISIC 2420)

The producer prices index for the manufacturing of basic precious metals and other non-ferrous metals includes the production of basic precious metals such as gold, silver, platinum from ore and scrap excluding extraction of ores, which is covered under the index of mining of other non-ferrous metals. It also covers the production and semi-manufacturing of lead, zinc and tin or their alloys from ores and scrap.

During the first quarter of 2022, the index value for this category stood at 239.2 basis points, up from 176.8 basis points recorded in the same quarter of the previous year. The annual inflation rate for this class increased to 35.3 percent in the quarter under review up from 33.6 percent recorded during the same period of last year.

Chart 8: Annual percentage change for manufacture of basic precious & other non-ferrous metals
3. Electricity, gas, steam and air conditioning supply

3.1 PPI for Electric power generation, transmission and distribution (ISIC 3510)

For the first quarter of 2022, the index for electric power generation, transmission and distribution increased to 111.0 basis points as opposed to 107.4 basis points registered in the same quarter of 2021. The annual inflation rate for local electric power generation, transmission and distribution increased to 3.4 percent in the first quarter of 2022 as opposed to a decline of 7.5 percent recorded in the same quarter of 2021.
4. **Electricity, gas, steam and air conditioning supply**

4.1 **PPI for Water collection, treatment and supply (ISIC 3600)**

The index for the PPI for water collection, treatment and supply continued to be stagnant at 144.3 basis points since the second quarter of 2019. The annual percentage change in the producer prices index for this category remained unchanged at 0.0 percent since the second quarter of 2020.

**Chart 10: Annual percentage change in PPI for water collection, treatment & supply**

Namibia Producer Price Index (NPPI): Technical notes

Definition
The Producer Price Index (PPI) measures the average changes in the prices of goods and services received by domestic producers for the output which is sold on the domestic market as well as on export market. The Namibia PPIs are based on output indices. The concepts and definitions of the PPI largely follow the guidelines provided in the “IMF Producer Price Index Manual Theory and Practice

Scope of NPPI
The NPPI includes all goods and services produced within Namibia economic territory imports excluded. Prices collected for the compilation and production of the NPPI are the basic prices received by the producers for the sale of the products on the local market as well as at international markets (exports). These prices exclude all taxes on products such as excise duty, value added tax (VAT) and transport. Subsidies on products received by the producers are included. In the absence of a Statistical Business Register in Namibia, the selection of establishments were based on a judgmental sample from a list of known businesses maintained by NSA (National Accountants), expert opinion and practical knowledge of the market.

Classification of selected industries
Industries are classified according to International Standard Industrial Classification of All Economic Activities (ISIC rev 4).

Determination of the weights and items
Establishment weights are based on 2015 production sales values for the sampled establishments. The selection of items was done using a cut off sampling, products were ranked in order of the value of sales by category and below 80% was used to select the products while in the case of establishments producing five products and below all products were selected for inclusion in the NPPI compilation.

Base period
The base period for the Namibia Producer Price Index is December 2015=100.

Methodology
The NPPI is calculated using a short-term Laspeyres formula. The major advantage of using modified Laspeyres is that it allows for substitution in elementary indices. The short–term Laspeyres index compares the previous period sales revenue for a set of goods to the current period revenue for the same set of goods.

The indices are weighted separately and it is not possible to combine them to produce an ‘average’ PPI for all three industries.
